Laboratory

Business Problem: Sales Analysis

Students implement a simple sales analysis algorithm using Python lists.

```
sales = [12000, 8500, 15400, 9200, 18100]

total = sum(sales)
average = total / len(sales)

print("Total Sales:", total)
print("Average Sales:", average)
```

MIS Context

> How can a company's monthly sales data be organized and processed efficiently?

Learning Outcome

Students will be able to transform a simple business problem into an algorithmic solution.
